

Statement on the efficacy of P3-steril against Coronavirus

Background

Coronaviruses are enveloped viruses causing human infections. Two different guidelines are available to support efficacy of disinfectants against enveloped viruses: EN 14476, using Vacciniavirus as a surrogate virus and a guideline of the German Society for the Prevention of Virus Disease (DVV) using Vacciniavirus and Bovine Viral Diarrhea Virus (BVDV) as surrogate viruses.

Rationale

According to guidance of the European Centers for Disease Control¹⁾ a solution of 0.05% benzalkonium chloride can be used as an effective disinfectant against Coronavirus. P3-steril contains 1.75% (w/w) benzalkonium chloride. In addition to that it contains 1,5% (w/w) Didecyldimethylammonium chloride as an active ingredient. The latter does not interfere with benzalkonium chloride. Both active have the same mode of action and have an additive effect.

Conclusion

Based on the above information and guideline it is concluded that P3-steril is effective against Coronavirus as a surface disinfectant, when used at a concentration of 3% with the minimum contact time needed to achieve a bactericidal effect.
